Content

- **Introduction**
  - What are the issues?
  - What are the resulting concerns?
- **What can be done?**
  - What others have tried
- **Infrastructure Assets Management (IAM)**
  - Why do it?
  - What to do and how?
- **IAM - is it for my community?**
Some of the Issues…

for everyone

- Infrastructure ages naturally
- Lack of maintenance/repairs accelerates the deterioration process
- Demand changes ↑ or ↓
- Resources constraints: financial, human, material
- Increasing expectations and regulatory requirements
- Competing priorities
Some of the Issues… for small water systems

- Small population (< 500)
- Financial stability
- Changing demographics
- Underpaid or volunteer system operators
- Multi-tasking operators
- Lack of technical expertise or access to it
- High servicing costs
- Difficulty to access education and training

(from Adaptive Policy Changes in the Management of Small Water Systems, Presentation by H. Khan)
These issues lead to concerns

- Failures leading to service interruptions and costly (to user and agency) repairs
- Decreasing level of service
  - Quality
  - Quantity
  - Health and safety hazards?
- Uncertain long term sustainability
- Increasing needs
You are not the only ones to have these concerns....
But there are options

From City of Hamilton
Amongst all this uncertainty... what to do?

- Cannot continue to operate as done for last 50 years.
- Aging and deterioration cannot be stopped but can be slowed down, controlled:
  - E.g., cathodic protection on metal pipes

- So the game plan is to:
  - Slow down deterioration/ Increase service life
  - Increase cost effectiveness/avoid unnecessary expenditures
  - Minimize unplanned interventions
  - Maintain/enhance level of service
And how to do all this?

• By managing the assets!

• InfraGuide definition of Asset Management:

Asset management — The combination of management, financial, economic, engineering, operational and other practices applied to physical assets with the objective of providing the required level of service in the most cost-effective manner.
Infrastructure Assets Management – Principles

• **Strategic and Proactive approach**
  - Based on sound data and information,
  - Requires interdepartmental collaboration, and
  - Essential: interdisciplinary management approach

• **Comprehensive long-term view of infrastructure performance and cost**
  - Emphasis on sustainability objectives

• **Explicit, visible, and transparent approach**
  - Effective communication among all its stakeholders

• **Business processes involving investment choices**
  - Policy and performance driven
  - Explicit trade-offs among competing priorities
Infrastructure Assets Management – Linkages

- Cannot discuss AM without dealing with:
  - Levels of service
    - What are they?
    - How are they defined?
    - What corporate objectives do they relate to?
  - Life-cycle of infrastructure
• Tolerability study Saskatoon/Regina
Infrastructure Assets Management – Warnings

- AM process NOT to be driven by technology
- ONE size does NOT fit all
- AM has to become a CULTURE within organization
  - People
  - Senior management/decision-makers leadership
- AM is not a one-time-deal:
  - Continuous (improvement) process
- AM must feed the decision-making process – support, NOT replace
- AM should have actionable outputs … not just another report
1. How is achievement assessed? (Policy objectives)

2. How are funding limitations dealt with? (Establishing priorities)

3. What do you have and where is it? (Inventory)

4. What is it worth? (Costs/replacement rates)

5. What is its condition and expected remaining service life? (Condition and capability analysis)

6. What is the level of service expectation and what needs to be done? (Capital and operating plans)

7. When do you need to do it? (Capital and operating plans)

8. How much will it cost and what is the acceptable level of risk? (Short- and long-term financial plans)

9. How do you ensure long-term affordability? (Short- and long-term financial plans)

Consideration: alternative levels of service and the acceptance of higher risk

Consideration: operational costs
Infrastructure Assets Management – How to (1)

- What do you have and where is it? (Inventory and location)
- What is it worth? (Costs/replacement rates)
- What is its condition and expected remaining service life? (Condition, capability and performance analysis)
- What is the level of service expectation, and what needs to be done? (Prioritization, capital and operating plans, alternative service mechanisms)
Asset Replacement Value
per 50’ property frontage

Total Value = $68,800

From City of Hamilton
0–25% of asset life
Minor Maintenance

25–50% of asset life
Major Maintenance

50–75% of asset life
Rehabilitation

75–100% of asset life
Replacement

Operating Budget

Capital Budget
Infrastructure Assets
Management – How to (2)

• **When do you need to do it?** (Prioritization, capital and operating plans)

• **How much will it cost and what is the acceptable level of risk(s)?** (Short- and long-term financial plan, risk analysis)

• **How do you ensure long-term affordability?** (Short- and long-term financial planning, alternative revenue sources) – further information on Capital Financing at the end of this presentation
IAM - Supporting decision-making

- At what level?
  - Operational (project, single network)
    - Prioritize
    - Develop financial plans
  - Tactical (across networks)
    - Coordination of works
    - Integration (e.g., data repositories)
  - Strategic (across the corporation)
    - Support initiatives (e.g., economic development)
Is IAM for your community?

• The 101 wrong reasons why not:
  - We are too small!
  - We don’t have the resources!
  - I’m alone and don’t have time!
  - It’s going to cost too much!
  - We don’t have enough data!
  - Council will never go for it!
  - .....  
  - It’s an accounting problem (PSAB 3150)!
  - .....  
  - .....
A good resource
Asset Management: A Handbook for Small Water Systems

One of the Simple Tools for Effective Performance (STEP) Guide Series
What Is the Asset Management Process?

Asset management consists of the following five steps:

1. **Taking an inventory.** Before you can manage your assets, you need to know what assets you have and what condition they are in. This information will help you schedule rehabilitations and replacements of your assets.

2. **Prioritizing your assets.** Your water system probably has a limited budget. Prioritizing your assets will ensure that you allocate funds to the rehabilitation or replacement of your most important assets.

3. **Developing an asset management plan.** Planning for the rehabilitation and replacement of your assets includes estimating how much money you will need each year to maintain the operation of your system each year. This includes developing a budget and calculating your required reserves.

4. **Implementing your asset management plan.** Once you have determined how much money you will have to set aside each year and how much additional funding (if any) you will need to match that amount, you need to work with your management and customers and with regulators to carry out your plan and ensure that you have the technical and financial means to deliver safe water to your customers.

5. **Reviewing and revising your asset management plan.** Once you have developed an asset management plan, do not stick it in a drawer and forget about it! Your asset management plan should be used to help you shape your operations. It is a flexible document that should evolve as you gain more information and as priorities shift.
Step #1 – How Do I Inventory My Assets?

Before you can manage your assets, you need to know what you have, what condition it is in, and how much longer you expect it to last. To complete an inventory, list all your assets and collect the following information for each:

1. **Condition**
2. **Age**
3. **Service history**
4. **Useful life**

The worksheets on the following pages will help you develop an asset inventory and keep track of important information. Detailed instructions are provided.

You may want to keep track of your assets on a computer spreadsheet or use custom software. Appendix D includes information on electronic programs you may want to use.

Inventoring your assets can be an intensive job. Get the best information that you can, but don’t get bogged down in this step and use estimates where needed. If you keep up with an asset management program, new information will become available as assets get replaced or rehabilitated, and your inventory of assets will improve.
Introduction to the System Inventory Worksheet

The following System Inventory Worksheet will help you:

- Identify all of your system's assets;
- Record the condition of your assets;
- Record the service history of your assets;
- Determine your assets' adjusted useful lives;
- Record your assets' ages; and,
- Estimate the remaining useful life of each of your assets. Usually, there are two steps to estimating useful life:

1. Determine the expected useful life by using the manufacturer's recommendations or the estimates provided in the box to the right. Adjust these numbers based on the specific conditions and experiences of your system.
2. Calculate an adjusted useful life by taking into account the service history and current condition of your asset.

Two copies of the worksheet are provided. The first copy is followed by instructions that will help you understand how to complete it. The second worksheet is an example. Appendix A has blank worksheets that you can photocopy and use.

Estimated Useful Lives

<table>
<thead>
<tr>
<th>Asset</th>
<th>Expected Useful Life (in years)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intake Structures</td>
<td>35-45</td>

</tbody>
</table>
Step #2 – How Do I Prioritize My Assets?

Once you have inventoried your assets, your next step will be to prioritize your assets based on their importance to your system. Prioritization means ranking your system’s assets to help you decide how to allocate resources. Factors involved in prioritization include:

- How soon will you have to replace an asset (its remaining useful life).
- How important the asset is to the provision of safe drinking water (its impact on public health).
- How important the asset is to the operation of your system.

Step #3 – How Do I Plan for the Future?

Now that you have prioritized your assets, you will have to determine how much it will cost to rehabilitate or replace them to properly protect public health and deliver safe water. You need to rehabilitate and replace your assets in a timely manner to reduce the risk of water quality issues in the future. You will need to consider the lead-time to budget and gather the necessary funds. By developing an asset management plan, you can allocate your resources in the most efficient way.

The Required Reserve Worksheet on the next few pages will lead you through the steps necessary to determine how much money you need to put in reserve each year (for the next five years) to fund your highest priority activities. This reserve should be protected from other use.

The worksheet will give you an idea of how much money you should set aside to fund your reserve account this year. Changes in your system’s finances and costs of new assets can change from year to year. It is important that you update this worksheet every year. This will ensure that you have enough reserves to cover necessary rehabilitations and improvements. This worksheet only helps account for additional funds you will need to rehabilitate or replace your assets. Standard O&M costs (e.g., chemicals for disinfection) are not included in the calculations on this worksheet.
Step #4 – How Do I Carry Out This Plan?

In the previous section, you may have discovered that you should be reserving additional money every year to cover replacing your assets. Preparing a financial forecast (by estimating how much revenue you expect for the next five years) will need to supplement your revenues to carry out your asset management plan.

If you don’t already have a five-year forecast, the Budgeting Worksheet on page 28 will help you complete this task. In addition, to increase or more efficiently use your revenues to operate and maintain your system and carry out your asset management plan you can:

- **Create additional reserve accounts.** Reserve all or some of the money you will need in a protected capital improvement reserve account and create an emergency account to fund unexpected repairs and replacements. You may be restricted in how much money can be placed in reserve accounts. Check with your state or federal regulations.

Step #5 – What Should I Do Next?

Once you have inventoried and prioritized your assets, determined how much money you will need to set aside each year to fund the rehabilitation and replacement of your assets, and explored funding options for your water system, you can use your asset management plan to help plan your water system’s future. You will have a good picture of when you will need to replace your assets and how much money you will need to fund those replacements and continue to deliver safe and secure drinking water to your customers.

Remember that the worksheets should be reviewed, revised, and updated on an annual basis. Your asset management plan should help you shape your system’s operations and should change as your priorities change. Current information in the worksheets provides a better picture of your system’s position, and better prepares you to meet your water system’s future needs.
Some information on capital financing
Capital Financing

• From internal and external sources
• Internal
  – Current operating revenues (property taxes and user fees)
  – Reserve funds (to be spent on specific projects)
  – Special charges (including special assessments, development charges, etc.)
• External
  – Federal/Provincial grants
  – Long term borrowing
<table>

<td>39.2 percent</td>
</tr>
</tbody>
</table>
Dedicated Funding

- **Utility or full-cost recovery models** (base utility billing, a levy on the utility bill and, for wastewater and storm water only, a surcharge on the water bill);
- **Property tax models** (dedicated tax increment or surcharge on property tax bill);
- **Fee-for-service models for potable water only** (user or access fees, frontage fees, and tapping fees);
- **Other models** (local improvement charges, development charges and public–private partnerships).
Alternative funding mechanisms (1)

- Special Levies
  - Economic instruments that ensure a funding source exists to cover needs that are difficult to fund through user pay, and for which there is a benefit in explicitly identifying them separately from the general tax levy.
  - The mechanics of this method include a variety of potential levy collection venues, such as:
    - a particular residential or commercial tax;
    - a general levy on the property tax bill; or
    - a rate base/utility levy for residential and/or commercial properties
Alternative funding mechanisms (2)

• Utility Models
  - A utility model exists where user fees collected are dedicated to the service, and the service is managed autonomously relative to other municipal services.
  - Entails management of capital assets, operations and maintenance on a cost-recovery basis through fees for service.
  - The fee for service must be sufficient to fund the needs of the infrastructure and overhead operations, such as administration, bill collection and management.
  - Only users of the service support the service through the fee for service. The amount paid by users is normally proportional to their use of the service.
Alternative funding mechanisms (3)

• Tax Exempt bonds
  - Only Ontario permits them (as of 2003)
    • Through Ontario Municipal Economic Infrastructure Financing Authority
    • Low interest loans to municipalities

• Public-Private Partnerships (P3s)

Source: Environmental Economics Branch, Economic and Regulatory Affairs Directorate, Environment Canada, Ottawa, mimeograph.
• According to Environment Canada, flat rate customers in Canada use 457 litres of water per capita per day compared to volume based customers who use only 269 litres per capita per day.

• There are four underlying and fundamental drivers for universal metering:
  – equity;
  – water efficiency and environmental stewardship;
  – economic management benefits; and
  – system management.
Accurate and timely water use measurement is the primary means used by water utilities to:

- create equitable charge-out rates for customers;
- reduce water use wastage and promote water efficiency;
- measure low and peak flow rates;
- minimize environmental impacts and the loads on wastewater facilities;
- measure use of water resource;
- generate revenue; and
- ensure future capital costs for the system are apportioned to users.
